

Mindset-Based Coaching for WellBeing and Resilience: A Case Study

Lixian Xie, MAPP, MPhil, University of Pennsylvania
Incoming PhD Student in Psychology, Columbia University

Introduction

- Coaching is increasingly recognized as a process that facilitates learning, resilience, and well-being (Grant, 2014; Theeboom et al., 2013).
- Although mindset-related constructs such as Growth Mindset and Optimism have been widely studied in psychology, their integration into coaching theory remains limited (Dweck, 2006; Seligman, 2006)
- This study introduces Mindset-Based Coaching (MBC), a coaching framework that conceptualizes coaching as a belief-shaping and meaning-making process.

Illustrative Case Study

Participant: Chinese late adolescent
Intervention: 10-session Mindset-Based Coaching (MBC); 14-week engagement.
Outcome Measures: PERMA Profiler, DASS-21, READ, 360° Feedback.

Mindset-Based Coaching (MBC)

Theory	Mechanisms	Intended Outcomes	Coaching Inquiries
Growth Mindset (Dweck, 2006)	Coaching inquiries that surface fixed beliefs about ability and failure.	Increased resilience and self-efficacy	What can you learn from this challenge?
	Reframing challenges as opportunities for learning and development.	Adaptive responses to setbacks	What can you try differently next time?
	Encouraging effort, strategy use, and help-seeking.	Enhanced learning orientation	When (where, and how) will you take action on your plans?
Optimistic Mindset (Seligman, 2006)	Examination of explanatory style (temporary vs. permanent; specific vs. universal; internal vs. external).	Improved emotional regulation	Is this affecting everything or just this specific situation?
	Reattribution of setbacks to contextual and changeable factors.	Reduced helplessness and rumination	What evidence suggests this situation might be temporary or permanent?
	Future-oriented envisioning	Greater resilience and hope	What factors contributed to this outcome?
Positive Mindset (PERMA model; Seligman, 2011)	Coaching inquiries that surface deficit beliefs	Enhanced well-being	Recall a recent experience that made you feel good. What emotions were present?
	Attention to positive emotions, engagement and positive relationships.	Increased positive affect, engagement and sense of meaning and achievement	What activities energize you or bring you alive?
	Exploration of meaning and accomplishment.	Strengthened relationships	What feels most meaningful or important to you right now?

Key Outcomes

Wellbeing

Significantly improved well-being, with gains in positive relationships, health, and happiness, and reductions in loneliness and negative affect

DASS-21

Significantly reduced psychological distress, with decreases in depression, anxiety, and stress.

Resilience

Improved resilience, with increases in family cohesion and personal competence.

Qualitative Findings

- Better emotional regulation
- Improved family relationships
- Increased self-confidence
- Greater goal clarity
- Stronger sense of purpose

Belief and Mindset Transformation in MBC

Discussion

- MBC conceptualizes coaching as a belief transformation process that supports well-being, resilience, and personal growth.
- MBC provides a theoretically grounded framework for understanding how coaching facilitates change.
- Future research is needed to examine MBC across diverse populations, contexts, and longitudinal settings.
